

What is claimed is:

- Sub
917
1. A drawer comprising:
a bottom wall,
an upstanding peripheral wall structure integral with the bottom wall and having an upper edge,
a partition extending across opposed portions of the peripheral wall structure for cooperation therewith and with the bottom wall to define a compartment, and
a tray mountable on the peripheral wall structure for movement between an open position uncovering the compartment and a closed position covering the compartment,
the tray having a bottom wall disposed below the upper edge of the peripheral wall structure.
 2. The drawer of claim 1, wherein the bottom wall is substantially rectangular in shape and the peripheral structure extends around the periphery of the bottom wall.
 3. The drawer of claim 1, wherein the tray includes flanges supportable on the peripheral wall structure at the upper edge thereof for accommodating sliding movement of the tray relative to the peripheral wall structure.
 4. The drawer of claim 1, wherein the tray defines an open-top storage volume.
 5. The drawer of claim 1, and further comprising a lock assembly for locking the tray to the partition.
 6. The drawer of claim 5, wherein the lock assembly includes a latch mechanism on the tray movable between locking and unlocking conditions relative to the partition.

6
7. The drawer of claim ¹8, wherein the lock assembly includes a latch mechanism on the partition movable between locking and unlocking conditions relative to the tray.

Sub
927
8. A drawer comprising:
a bottom wall,
an upstanding peripheral wall structure integral with the bottom wall,
a partition extending across opposed portions of the peripheral wall structure for cooperation therewith and with the bottom wall to define a compartment,
a tray mountable on the peripheral wall structure for movement between an open position uncovering the compartment and a closed position covering the compartment,
a lock mechanism carried by the tray and selectively movable between locking and unlocking conditions, and
a keeper structure on the partition engageable with the lock mechanism in its locking condition for retaining the tray in its closed position.

9. The drawer of claim 8, wherein the lock mechanism is key-actuatable.

10. The drawer of claim 8, wherein the lock mechanism includes a movable latch element, the keeper structure including a slot in the partition for receiving the latch element.

11. The drawer of claim 8, wherein the tray includes lock support structure at a forward end thereof.

12. The drawer of claim 11, wherein the lock support structure includes a flange depending below the bottom wall of the drawer for engagement with the partition to prevent access to space between the tray and the partition when the tray is locked in its closed position.

10038842-010302

13. The drawer of claim 8, and further comprising: a forwardly-projecting flange at a rear end of the peripheral wall structure at an upper edge thereof, the tray having a rear end receivable beneath the flange when the tray is in its closed position.

14. A tray comprising:

a peripheral wall structure having an upper edge,

a bottom wall integral with the peripheral wall structure and spaced below the upper edge,

flange structure extending laterally outwardly from the wall structure at the upper edge,

and

lock structure on at least one of the peripheral wall structure and the bottom wall.

15 The tray of claim 14, wherein the bottom wall is substantially rectangular in shape, the peripheral wall structure extending around the periphery of the bottom wall.

16. The tray of claim 14, wherein the lock structure includes a lock mechanism carried by the peripheral wall structure.

17. The tray of claim 16, wherein the peripheral wall structure includes forwardly projecting lock support structure supporting the lock mechanism.

18. The tray claim 14, wherein the lock structure includes a keeper slot formed through the bottom wall.

19. The tray of claim 18, wherein the lock structure includes plural keeper slots formed through the bottom wall.

20. The tray of claim 19, and further comprising a channel-shaped cover disposed on the bottom wall and covering the keeper slots to prevent access thereto from above the tray.

21. A method of providing a lockable portion of a drawer and a movable storage volume on the drawer, comprising:

partitioning the drawer to define an open-top compartment therein,

providing a tray defining an open-top storage volume, and

supporting the tray on the drawer for movement between an open position uncovering the compartment and a closed condition covering the compartment.

22. The method of claim 21, wherein the partitioning includes dividing the drawer into front and rear compartments.

23. The method of claim 21, wherein the supporting includes slidably supporting the tray on the drawer for a sliding movement between the open and closed positions.

24. The method of claim 21, and further comprising locking the tray to the partition.

25. The method of claim 24, and further comprising reversibly supporting the tray on the drawer in either of two orientations respectively having different opposed ends facing forwardly, and locking the tray to the partition in either of its two orientations.
